COMPUTER

A computer is a machine which compute data and produce result as an information. It is operate in low voltage. Human can do computation, but what if a machine do the same thing with less time and human effort? This question is enough to say the importance of computer. Apart from human machine is of no commonsense.

A man can do calculation. With the help of computer human can do calculation with less time and less human effort. By doing thing with a consistent mindset humans can be tired. But using computer we can do things at anytime anywhere and any amount of work. Because computer is a machine it don't have commonsense. In situation which need commonsense computer can't do anything. But developments comes in technologies and information can make a computer to think. Robots are the examples.

Nowadays computer gets a role in our day to day life. Computer has used to store information. It computes data of any type and can be stored in its storage module. It use ALU unit for arithmetic and logic calculation. Control unit controls overall functions of the computer. User interacts with the system by using the interfaces. Interfaces can be input or output devices. There is no offices now without a computer today.

Computer is a machine which has an important role in our life. It's advantages makes it role very important.
